Acknowledgments

We'd like to thank all the people who were essential to the realization of this project: to Larry Dunlap, Jim Rothermel and David Scott for contributing some cool blues vocabulary; to Michael Zisman and Jim Nadel for help with the text; to Chuck Gee for numerous helpful suggestions and another world-class music copying job; to David Marck, Ed Fuqua and Chris Roselli for their "way deep in the pocket" playing on the accompanying CD; to Peter Karl Studios, Brooklyn, NY for the excellent recording of the CD and Gary Mankin of San Francisco for the masterful mixing and mastering work; to Chuck Stewart, Bill King and Paul Hoeffler for the classic photographs; to Attila Nagy for the cover and text graphics; to Kevin Neireiter (www.jazzlandscapes.com) for the beautiful cover artwork of McCoy Tyner; to all the great jazz musicians past and present who inspire us to learn and grow in the music; and to our families, who made it all possible.

Dan Greenblatt & Chuck Sher

About The Author

Saxophonist and educator Dan Greenblatt spent 24 years on the jazz scene in Seattle, where he was best known for his performances and recordings with bassist/composer Chuck Metcalf and with the Seattle Repertory Jazz Orchestra. In these groups he worked with all of Seattle's top jazz musicians, such as Jay Thomas, Marc Seales, Randy Halberstadt, and Don Lanphere, as well as many national artists including Quincy Jones, Clark Terry, Ernestine Anderson, George Cables, Arturo Sandoval, Jimmy Heath, and Frank Wess. As an educator, Dan was the saxophone and improvisation coach for ten years for Seattle's award-winning and nationally recognized jazz programs at Washington Middle School, Garfield High School and Roosevelt High School.

Greenblatt moved to New York in 2002 to teach at LaGuardia High School for the Performing Arts. He joined the faculty of the Jazz & Contemporary Music Program at New School University in 2003, and became the program's Director of Academic Affairs in 2004.

CHAPTER 1 • Basic Blues Theory

If you want to learn how to play jazz, one of the best places to begin is with the blues. There are several reasons for this.

First of all, the basic Blues form is one of the simplest in all of jazz.

Second, the basic Blues form is extremely widespread. There are hundreds of commonly played jazz pieces based on the Blues structure, and it also is central to most other forms of contemporary music. So when you learn how to improvise on the Blues, you are dealing with something familiar and you learn something that will be of continuing value.

Finally, the basic Blues form is extremely flexible, with many variations, and it is a form to which you will return throughout your development as an improviser. Rather than leaving the Blues behind as you get more sophisticated, you bring the Blues along with you on your path of development.

Getting Started

EXERCISE #1

Let's start with a fairly simple Blues at a relaxed tempo, the "First Step Blues." Read through the melody a few times at a comfortable tempo. Then listen carefully to how the melody is played on the saxophone track (**CD Track #1**, first two choruses).

Finally, try to play the melody along with the rhythm section by turning off the saxophone track on the left channel. Try imitating the swing feel and the quarter-note articulation from the saxophone track.

CD Track #19 has both Bb and A tuning notes, if you need them.

[*Note for horn players*: In the Bb version of this book, some exercises will fit better with the range of the trumpet and some with the range of the saxophone. Please adjust the octaves for yourself, if necessary.]

After the melody, the rhythm section continues to play the Blues form for several choruses, and then the saxophone comes back in with the melody at the end. That middle section, with the rhythm section playing the Blues form, is your chance to do some improvising. But the big question is, "What notes should I use to improvise with?" The most common answer is "use the Blues Scale" in the key of the tune. In the key of Bb, it looks like this:

The "Blues Scale" provides the beginning improviser with several things of value. For one, it greatly simplifies the problem of playing on the chord changes. You simply stay on the same scale throughout your solo, and ignore the changes. Moreover, the "Blues Scale" has a familiar, "down-home" sound, so you can capture a "blue" mood almost without effort.

Problems with the "Blues Scale"

There is a major problem with this typical advice, however, which is that aspiring improvisers using this approach almost always sound bad. There are two main reasons for this.

First of all, the "Blues Scale" is missing too many important notes. This makes it a very limited vehicle, unable to carry the variety of phrases and moods that allow you to create contrasts and develop a story-like improvisation. The biggest missing note in this scale is the major 3rd, and also missing are the 2nd and 6th notes of the major scale. So the common six-note "Blues Scale" effectively handcuffs you, paints you into a corner. The effort to simplify ends up oversimplifying.

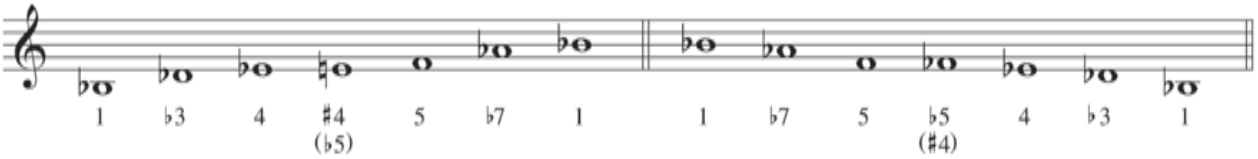
The second reason that "Blues Scale" solos generally sound bad is that they contain no motion, no harmonic movement. Almost all jazz involves "playing the changes," where your improvisation reflects the harmonic motion of the song. Exclusive use of the "Blues Scale" provides a fundamentally static approach to a fundamentally dynamic art form.

The vast majority of beginning improvisers, however, are not ready to absorb the complex system of chords and scales that evolved jazz musicians use. So the puzzle becomes one of developing an approach that is simple, but not too simple, which retains the advantages of the "Blues Scale" without missing the other good notes, and which gets you playing changes without requiring you to digest the entire system of Western Harmony.

There are Two "Blues Scales!"

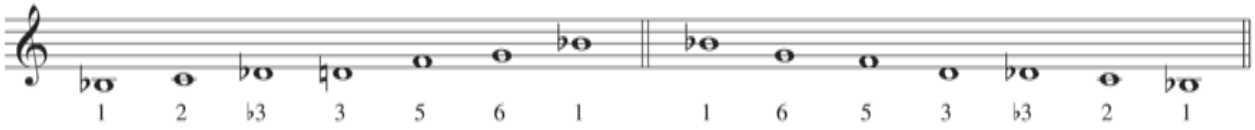
The solution to the puzzle is that there are really **two** basic Blues Scales that are commonly used by jazz improvisers, rather than one single scale. One is the Blues Scale we already looked at. Because of its b3rd, this scale has a decidedly minor sound, so from now on we will refer to it as the "Minor Blues Scale."

B♭ Minor Blues Scale



The second Blues Scale has a decidedly major sound because of the inclusion of the major 3rd (even though it also contains the minor 3rd as well). We will call this scale the "Major Blues Scale." In the key of Bb, it looks like this:

B♭ Major Blues Scale



Practicing the Scales

EXERCISE #2

First you need to thoroughly learn and memorize the notes in these two scales, including the whole range from the lowest to the highest notes you can play on your instrument. As one method of really learning the scales inside-and-out, we encourage you to compose scalar exercises that both rehearse the scale notes and simultaneously have a satisfying melodic contour. For example, try this one-and-a-half octave version of the Bb Major Blues Scale:

EXERCISE #3

Here is a sample way to practice the Bb Minor Blues Scale, again with a line that has some melodic interest:
